

Test Update

From Your Laboratory Service Provider, PathGroup Labs

Testing Provided on Site for Mumps IgG

Samuel Smith, MD Lab Director / Jeff Johnson, Clinical Lab Manager/
Crystal Davenport, Lead Tech Special Chemistry

This change will take effect March 12, 2009

Overview and Clinical Utility:

Effective March 12, 2009, PathGroup Labs will begin performing Mumps IgG testing in house.

Test Methodology:

Mumps IgG is for the semi-quantitative detection of human IgG antibodies to mumps virus in human serum by enzyme immunoassay. Individual serum specimens may be used for the determination of immune status. Paired (acute/convalescent) sera may be used to demonstrate seroconversion or significant rises in antibody level, as an aid in the diagnosis of primary infection.

Mumps IgG:

New Test:	Previous Test:
Methodology: Semi-Quantitative EIA	Methodology: Semi-Quantitative ELISA
< 0.90: Negative- No significant level of detectable Mumps IgG antibody. Presumed non-immune to Mumps infection.	0.89 IV or less: Negative - No significant level of detectable Mumps IgG antibody.
≥ 0.90 to ≤1.09: Equivocal - Repeat testing in 10-14 days may be helpful.	0.90-1.09 IV: Equivocal - Repeat testing in 10-14 days may be helpful.
≥ 1.10: Positive- IgG antibody to Mumps detected which may indicate a current or past exposure/immunization to Mumps. Positive IgG antibody levels in the absence of current clinical symptoms may indicate immunity.	1.10 IV or greater: Positive - IgG antibody to Mumps detected, which may indicate a current or past exposure/immunization to mumps. Positive IgG antibody levels in the absence of current clinical symptoms may indicate immunity.
Units: Index	Units: IV

Specimen Collection and Storage:

- 1) Collect specimen in a serum separator tube.
 - a) Allow serum tube to clot for 30 minutes.
Spin serum separator tube 10-15 minutes @ 3500 rpm.
- 2) Serum specimens are stable refrigerated for 2 days or frozen for 30 days.
