TEST UPDATE
Kleihauer-Betke Fetal Stain

Lorne Holland, MD, Lab Director
Jeff Johnson, AVP of Operations

Effective September 24, 2012

The Kleihauer-Betke Fetal Stain has been discontinued and replaced with Fetal Cell Assay by Flow Cytometry as the routine method to assess fetal-maternal hemorrhage quantification and recommended RhIG dosage.

The traditional slide based Kleihauer-Betke test is a time consuming method with high rates of inter-observer result variation and suboptimal precision. A more accurate, improved methodology is achieved via the Fetal Cell Assay by Flow Cytometry.

Ordering Information:

<table>
<thead>
<tr>
<th>New Test Name: Fetal Cell Assay by Flow Cytometry</th>
<th>Previous Test Name: Kleihauer-Betke Fetal Stain</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Test Code: FETAL</td>
<td>Previous Test Code: KLEIH</td>
</tr>
</tbody>
</table>

Specimen Collection and Storage:

Specimen requirements are unchanged.
- Specimen: 5 mL EDTA Whole Blood
- Temperature: Room Temperature
- Stability: 3 days

Resulting:

- Result format remains unchanged: Percent (%) of fetal cells detected; Recommended RhIG dose.
